Realistic Cat Demo

A single-cat demo from Realistic Cat Pack - Customizable Fur.

Demo of the full Realistic Cat Pack

The included brown shorthair tabby is a demo model from the full Realistic Cat Pack - Customizable Fur. Use this sample to try the cat, animations and fur before exploring the complete package.

View Realistic Cat Pack - Customizable Fur on the Unity Asset Store

What is included

One rigged brown shorthair tabby, seven animation clips, six prefabs and three interactive showcase scenes. HD prefabs include customizable fur and three LOD levels. Simplified prefabs use a 1K albedo texture and omit fur.

1. Choose your render pipeline

Project pipeline	Prefab folder	Requirement
Built-in	Prefabs/Built-in	Unity 2022.3 LTS
URP	Prefabs/URP	Universal RP 14.0.12
HDRP	Prefabs/HDRP	High Definition RP 14.0.12

Prepared with Unity 2022.3.62f3. Install the matching URP or HDRP package before importing its shaders. Render-pipeline packages are Unity Package Manager dependencies and are not bundled in this asset.

2. Open the showcase

Choose **Tools > Realistic Cat Demo > Open [pipeline] showcase**, then press **Play**. The menu configures the active project to use the chosen showcase pipeline. Save your work first; a separate evaluation project is recommended when switching pipelines.

3. Add the cat to your own scene

Drag **Cat_05.prefab** from **Prefabs/[pipeline]/HD** into your scene. Choose the **Mobile** subfolder for the simplified version. The cat prefab does not need the showcase camera, stage or demo script.

Animation & interaction

Preview the model, explore poses, and use the supplied animation data.

Showcase controls

Input	Action
On-screen Previous / Next	Select an animation
Up / Down arrows	Select the next / previous animation
Space or Play / Pause button	Pause or resume playback
Right mouse button + drag	Orbit the camera manually
Mouse wheel	Zoom in or out
O / R	Toggle automatic orbit / reset camera
H	Show or hide the interface
Ctrl + Shift + K	Save an image to the project Screenshots folder

Seven supplied animations

Idle, Walk, Run, Jump, Attack_L, Attack_R, Dying. The clips and Animator Controller are in **Cats/Cat_05/Animations**. The prefabs already have an Animator configured with the supplied controller.

The showcase plays clips through Unity Playables and loops them for inspection. This preview behavior is independent of the Animator Controller. In your own game, trigger states and control movement through your gameplay code; the demo is a model and animation sample, not a character controller.

A single-cat scene

This sample contains one brown shorthair tabby from **Realistic Cat Pack - Customizable Fur**. The other cats and coat variations belong to the full package linked on page 1. The stage, lighting and camera are provided for evaluation and can be omitted when using the prefab in a game.

Fur, LODs & troubleshooting

Adjust the appearance and choose the level of rendering detail you need.

Fur material controls

On an HD prefab, select the fur material to access **Tint, Length, Strand density, Tip taper, Root shade** and **Tip shade**. Additional foldouts expose lighting, grooming and texture-map controls. Duplicate a material first if you want to retain the original appearance.

Three geometry-based LOD levels

Level	Appearance
LOD 0	Full shell fur and hair-card detail
LOD 1	Reduced fur geometry
LOD 2	Body without fur geometry

Unity selects LODs using screen-relative size. Camera field of view, object scale and Quality Settings LOD Bias all affect the switch. Select the prefab and use **Tools > Realistic Cat Demo > Configure LOD distances** to author thresholds from reference distances.

Simplified prefabs

The **Mobile** folders contain fur-free prefabs with simpler materials and a 1K albedo texture. The folder name describes the lighter asset variant; it does not make HDRP a mobile pipeline. Use URP for a mobile-oriented project and profile on your target device.

Quick checks

Pink materials: confirm that your prefab folder matches the active render pipeline and that the required pipeline package is installed.
No animation: press Play in the showcase, or check the Animator and active state in your own scene.
Fur disappears at a distance: inspect the LOD Group thresholds and LOD Bias.
Different lighting: compare with the matching showcase scene and its reflection settings.

This demo is a sample of **Realistic Cat Pack - Customizable Fur**. It uses independent asset GUIDs, a separate script namespace and custom shader names, so both packages can coexist in the same project. See page 1 for the full-package link.
